7th Edition., Pearson, 2017

Chapter 6

Basic SQL

Outline

- SQL Data Definition and Data Types
- Specifying Constraints in SQL
- Basic Retrieval Queries in SQL
- INSERT, DELETE, and UPDATE Statements in SQL
- Additional Features of SQL

Basic SQL

SQL language

- Considered one of the major reasons for the commercial success of relational databases
- Now popularly known as "Structured Query Language".
- SQL is an informal or practical rendering of the relational data model with syntax

SQL Data Definition, Data Types, Standards

Terminology:

 Table, row, and column used for relational model terms relation, tuple, and attribute

CREATE statement

- Main SQL command for data definition
- The language has features for:
 Data definition, Data Manipulation, Transaction control (Transact-SQL, Ch. 20),
 Indexing (Ch.17), Security specification (Grant and Revoke- see Ch.30),
 Active databases (Ch.26), Multi-media (Ch.26), Distributed databases (Ch.23) etc.

SQL Standards

- SQL has gone through many standards: starting with SQL-86 or SQL 1.A. SQL-92 is referred to as SQL-2.
- Later standards (from SQL-1999) are divided into **core** specification and specialized **extensions**. The extensions are implemented for different applications such as data mining, data warehousing, multimedia etc.
- SQL-2006 added XML features (Ch. 13); In 2008 they added Object-oriented features (Ch. 12).
- SQL-3 is the current standard which started with SQL-1999. It is not fully implemented in any RDBMS.

Schema and Catalog Concepts in SQL

SQL schema

- Identified by a schema name
- Includes an authorization identifier and descriptors for each element
- Schema elements include
 - Tables, constraints, views, domains, and other constructs
- Each statement in SQL ends with a semicolon

• CREATE SCHEMA statement

• CREATE SCHEMA COMPANY AUTHORIZATION 'Jsmith';

Catalog

- Named collection of schemas in an SQL environment
- SQL also has the concept of a cluster of catalogs.

The CREATE TABLE Command in SQL

- Specifying a new relation
 - Provide name of table
 - Specify attributes, their types and initial constraints
- Can optionally specify schema:
 - CREATE TABLE COMPANY.EMPLOYEE ...
 or
 - CREATE TABLE EMPLOYEE ...

Base tables (base relations)

 Relation and its tuples are actually created and stored as a file by the DBMS

Virtual relations (views)

• Created through the CREATE VIEW statement. Do not correspond to any physical file.

COMPANY relational database schema (Fig. 5.7)

One possible database state for the COMPANY relational database schema (Fig. 5.6)

EMPLOYEE

| Fname | Minit | Lname | Ssn | Bdate | Address | Sex | Salary | Super_ssn | Dno |
|----------|-------|---------|-----------|------------|--------------------------|-----|--------|-----------|-----|
| John | В | Smith | 123456789 | 1965-01-09 | 731 Fondren, Houston, TX | М | 30000 | 333445555 | 5 |
| Franklin | Т | Wong | 333445555 | 1955-12-08 | 638 Voss, Houston, TX | М | 40000 | 888665555 | 5 |
| Alicia | J | Zelaya | 999887777 | 1968-01-19 | 3321 Castle, Spring, TX | F | 25000 | 987654321 | 4 |
| Jennifer | S | Wallace | 987654321 | 1941-06-20 | 291 Berry, Bellaire, TX | F | 43000 | 888665555 | 4 |
| Ramesh | K | Narayan | 666884444 | 1962-09-15 | 975 Fire Oak, Humble, TX | М | 38000 | 333445555 | 5 |
| Joyce | Α | English | 453453453 | 1972-07-31 | 5631 Rice, Houston, TX | F | 25000 | 333445555 | 5 |
| Ahmad | V | Jabbar | 987987987 | 1969-03-29 | 980 Dallas, Houston, TX | М | 25000 | 987654321 | 4 |
| James | Е | Borg | 888665555 | 1937-11-10 | 450 Stone, Houston, TX | М | 55000 | NULL | 1 |

DEPARTMENT

| Dname | <u>Dnumber</u> | Mgr_ssn | Mgr_start_date |
|----------------|----------------|-----------|----------------|
| Research | 5 | 333445555 | 1988-05-22 |
| Administration | 4 | 987654321 | 1995-01-01 |
| Headquarters | 1 | 888665555 | 1981-06-19 |

DEPT_LOCATIONS

| <u>Dnumber</u> | Dlocation | |
|----------------|-----------|--|

| 123456789 | Elizabeth | F | 1967-05-05 | Spouse |

SQL CREATE TABLE data definition statements for defining the COMPANY schema from Figure 5.7 (Fig. 6.1)

```
CREATE TABLE EMPLOYEE
       (Fname
                                   VARCHAR(15)
                                                               NOT NULL.
        Minit
                                   CHAR.
                                   VARCHAR(15)
        Lname
                                                               NOT NULL.
        Ssn
                                   CHAR(9)
                                                               NOT NULL.
        Bdate
                                   DATE.
        Address
                                   VARCHAR(30),
        Sex
                                   CHAR,
        Salary
                                   DECIMAL(10,2),
                                   CHAR(9),
        Super_ssn
                                                               NOT NULL,
        Dno
                                   INT
       PRIMARY KEY (Ssn),
CREATE TABLE DEPARTMENT
       (Dname
                                   VARCHAR(15)
                                                               NOT NULL,
        Dnumber
                                   INT
                                                               NOT NULL.
        Mgr_ssn
                                   CHAR(9)
                                                               NOT NULL.
        Mgr_start_date
                                   DATE,
       PRIMARY KEY (Dnumber),
       UNIQUE (Dname),
       FOREIGN KEY (Mgr_ssn) REFERENCES EMPLOYEE(Ssn) );
CREATE TABLE DEPT LOCATIONS
       ( Dnumber
                                   INT
                                                               NOT NULL,
        Dlocation
                                   VARCHAR(15)
                                                               NOT NULL.
       PRIMARY KEY (Dnumber, Dlocation),
       FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber) );
```

```
CREATE TABLE PROJECT
       (Pname
                                   VARCHAR(15)
                                                               NOT NULL.
        Pnumber
                                   INT
                                                               NOT NULL,
                                   VARCHAR(15),
        Plocation
        Dnum
                                   INT
                                                               NOT NULL,
       PRIMARY KEY (Pnumber),
       UNIQUE (Pname),
       FOREIGN KEY (Dnum) REFERENCES DEPARTMENT(Dnumber) );
CREATE TABLE WORKS ON
       (Essn
                                   CHAR(9)
                                                               NOT NULL,
        Pno
                                   INT
                                                               NOT NULL,
                                   DECIMAL(3,1)
        Hours
                                                               NOT NULL,
       PRIMARY KEY (Essn. Pno).
       FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn),
       FOREIGN KEY (Pno) REFERENCES PROJECT(Pnumber) );
CREATE TABLE DEPENDENT
        Essn
                                   CHAR(9)
                                                               NOT NULL.
        Dependent name
                                   VARCHAR(15)
                                                               NOT NULL,
        Sex
                                   CHAR.
        Bdate
                                   DATE,
        Relationship
                                   VARCHAR(8),
       PRIMARY KEY (Essn, Dependent_name),
       FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn));
```

Some foreign keys may cause errors

- Specified either via:
 - Circular references
 - Or because they refer to a table that has not yet been created
- DBA's have ways to stop referential integrity enforcement to get around this problem.

Attribute Data Types and Domains in SQL

Basic data types

- Numeric data types
 - Integer numbers: INTEGER, INT, and SMALLINT
 - Floating-point (real) numbers: FLOAT or REAL, and DOUBLE PRECISION
- Character-string data types
 - Fixed length: CHAR (n), CHARACTER (n)
 - Varying length: VARCHAR (n), CHAR VARYING (n), CHARACTER VARYING (n)

- Bit-string data types
 - **Fixed length:** BIT (n)
 - Varying length: BIT VARYING (n)
- Boolean data type
 - Values of TRUE or FALSE or NULL
- **DATE** data type
 - Ten positions
 - Components are YEAR, MONTH, and DAY in the form YYYY-MM-DD
 - Multiple mapping functions available in RDBMSs to change date formats

Additional data types

- Timestamp data type
 Includes the DATE and TIME fields
 - Plus a minimum of six positions for decimal fractions of seconds
 - Optional WITH TIME ZONE qualifier
- INTERVAL data type
 - Specifies a relative value that can be used to increment or decrement an absolute value of a date, time, or timestamp
- DATE, TIME, Timestamp, INTERVAL data types can be cast or converted to string formats for comparison.

Domain

- Name used with the attribute specification
- Makes it easier to change the data type for a domain that is used by numerous attributes
- Improves schema readability
- Example:
 - CREATE DOMAIN SSN TYPE AS CHAR(9);

• TYPE

• User Defined Types (UDTs) are supported for object-oriented applications. (See Ch.12) Uses the command: CREATE TYPE

Specifying Constraints in SQL

Basic constraints:

- Relational Model has 3 basic constraint types that are supported in SQL:
 - Key constraint: A primary key value cannot be duplicated
 - Entity Integrity Constraint: A primary key value cannot be null
 - Referential integrity constraints: The "foreign key" must have a value that is already present as a primary key, or may be null.

Specifying Attribute Constraints

Other Restrictions on attribute domains:

- Default value of an attribute
 - **DEFAULT** <value>
 - NULL is not permitted for a particular attribute (NOT NULL)
- CHECK clause
 - Dnumber INT **NOT NULL** CHECK (Dnumber > 0 AND Dnumber < 21);

Specifying Key and Referential Integrity Constraints

PRIMARY KEY clause

- Specifies one or more attributes that make up the primary key of a relation
- Dnumber INT PRIMARY KEY;

• UNIQUE clause

- Specifies alternate (secondary) keys (called CANDIDATE keys in the relational model).
- Dname VARCHAR (15) UNIQUE;

• FOREIGN KEY clause

- Default operation: reject update on violation
- Attach referential triggered action clause
 - Options include SET NULL, CASCADE, and SET DEFAULT
 - Action taken by the DBMS for SET NULL or SET DEFAULT is the same for both ON DELETE and ON UPDATE
 - CASCADE option suitable for "relationship" relations

Giving Names to Constraints

- Using the keyword CONSTRAINT
 - Name a constraint
 - Useful for later altering

Default attribute values and referential integrity triggered action specification (Fig. 6.2)

```
CREATE TABLE EMPLOYEE
              INT
                          NOT NULL
                                       DEFAULT 1.
    Dno
   CONSTRAINT EMPPK
    PRIMARY KEY (Ssn),
   CONSTRAINT EMPSUPERFK
    FOREIGN KEY (Super_ssn) REFERENCES EMPLOYEE(Ssn)
                 ON DELETE SET NULL
                                         ON UPDATE CASCADE.
   CONSTRAINT EMPDEPTFK
    FOREIGN KEY(Dno) REFERENCES DEPARTMENT(Dnumber)
                 ON DELETE SET DEFAULT
                                         ON UPDATE CASCADE);
CREATE TABLE DEPARTMENT
    Mgr_ssn CHAR(9)
                         NOT NULL
                                       DEFAULT '888665555',
   CONSTRAINT DEPTPK
    PRIMARY KEY(Dnumber),
   CONSTRAINT DEPTSK
    UNIQUE (Dname).
   CONSTRAINT DEPTMGRFK
    FOREIGN KEY (Mgr ssn) REFERENCES EMPLOYEE(Ssn)
                 ON DELETE SET DEFAULT ON UPDATE CASCADE):
CREATE TABLE DEPT LOCATIONS
   PRIMARY KEY (Dnumber, Dlocation),
   FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber)
               ON DELETE CASCADE
                                         ON UPDATE CASCADE):
```

Specifying Constraints on Tuples Using CHECK

- Additional Constraints on individual tuples within a relation are also possible using CHECK
- CHECK clauses at the end of a CREATE TABLE statement
 - Apply to each tuple individually
 - CHECK (Dept_create_date <= Mgr_start_date);

Basic Retrieval Queries in SQL

- SELECT statement
 - One basic statement for retrieving information from a database
- SQL allows a table to have two or more tuples that are identical in all their attribute values
 - Unlike relational model (relational model is strictly set-theory based)
 - Multiset or bag behavior
 - Tuple-id may be used as a key

The SELECT-FROM-WHERE Structure of Basic SQL Queries

Basic form of the SELECT statement:

```
SELECT <attribute list>
FROM 
WHERE <condition>;
```

where

- <attribute list> is a list of attribute names whose values are to be retrieved by the query.
- is a list of the relation names required to process the query.
- <condition> is a conditional (Boolean) expression that identifies the tuples to be retrieved by the query.

Logical comparison operators

• =,
$$<$$
, $<$ =, $>$ =, and $<>$

Projection attributes

Attributes whose values are to be retrieved

Selection condition

• Boolean condition that must be true for any retrieved tuple. Selection conditions include join conditions (see Ch.8) when multiple relations are involved.

Basic Retrieval Queries

Query 0. Retrieve the birth date and address of the employee(s) whose name is 'John B. Smith'.

Q0: SELECT Bdate, Address

FROM EMPLOYEE

WHERE Fname='John' AND Minit='B' AND Lname='Smith';

| <u>Bdate</u> | <u>Address</u> | | |
|--------------|--------------------------|--|--|
| 1965-01-09 | 731 Fondren, Houston, TX | | |

Query 1. Retrieve the name and address of all employees who work for the 'Research' department.

Q1: SELECT Fname, Lname, Address

FROM EMPLOYEE, DEPARTMENT

WHERE Dname='Research' AND Dnumber=Dno;

| <u>Fname</u> | <u>Lname</u> | <u>Address</u> |
|--------------|--------------|--------------------------|
| John | Smith | 731 Fondren, Houston, TX |
| Franklin | Wong | 638 Voss, Houston, TX |
| Ramesh | Narayan | 975 Fire Oak, Humble, TX |
| Joyce | English | 5631 Rice, Houston, TX |

Query 2. For every project located in 'Stafford', list the project number, the controlling department number, and the department manager's last name, address, and birth date.

Q2: SELECT Pnumber, Dnum, Lname, Address, Bdate

FROM PROJECT, DEPARTMENT, EMPLOYEE

WHERE Dnum=Dnumber AND Mgr_ssn=Ssn AND

Plocation='Stafford';

Pnumber Dnum (c) Address Bdate Lname 291Berry, Bellaire, TX 10 Wallace 1941-06-20 4 291Berry, Bellaire, TX Wallace 1941-06-20 30 4

Ambiguous Attribute Names

- Same name can be used for two (or more) attributes in different relations
 - As long as the attributes are in different relations
 - Must qualify the attribute name with the relation name to prevent ambiguity

Q1A: SELECT Fname, EMPLOYEE.Name, Address

FROM EMPLOYEE, DEPARTMENT

WHERE DEPARTMENT.Name='Research' AND

DEPARTMENT.Dnumber=EMPLOYEE.Dnumber;

| <u>Fname</u> | <u>Lname</u> | <u>Address</u> |
|--------------|--------------|--------------------------|
| John | Smith | 731 Fondren, Houston, TX |
| Franklin | Wong | 638 Voss, Houston, TX |
| Ramesh | Narayan | 975 Fire Oak, Humble, TX |
| Joyce | English | 5631 Rice, Houston, TX |

Aliasing, and Renaming

- Aliases or tuple variables
 - Declare alternative relation names E and S to refer to the EMPLOYEE relation twice in a query:

Query 8. For each employee, retrieve the employee's first and last name and the first and last name of his or her immediate supervisor.

FROM EMPLOYEE AS E, EMPLOYEE AS S

WHERE E.Super_ssn=S.Ssn

| E.Fname | E.Lname | S.Fname | S.Lname |
|----------|---------|----------|---------|
| John | Smith | Franklin | Wong |
| Franklin | Wong | James | Borg |
| Alicia | Zelaya | Jennifer | Wallace |
| Jennifer | Wallace | James | Borg |
| Ramesh | Narayan | Franklin | Wong |
| Joyce | English | Franklin | Wong |
| Ahmad | Jabbar | Jennifer | Wallace |

Note Recommended practice to abbreviate names and to prefix same or similar attribute from multiple tables.

• The attribute names can also be renamed

```
FROM EMPLOYEE AS E(Fn, Mi, Ln, Ssn, Bd, Addr, Sex, Sal, Sssn, Dno)
```

- Note that the relation EMPLOYEE now has a variable name E which corresponds to a tuple variable
- The "AS" may be dropped in most SQL implementations

Unspecified WHERE Clause and Use of the Asterisk

- Missing WHERE clause
 - Indicates no condition on tuple selection

Q9: SELECT Ssn
FROM EMPLOYEE;

- If more than one relation is specified in the FROM clause and there is no WHERE clause, effect is a CROSS PRODUCT
 - Result is all possible tuple combinations

Q10: SELECT Ssn, Dname FROM EMPLOYEE, DEPARTMENT;

- Specify an asterisk (*)
 - Retrieve all the attribute values of the selected tuples
 - The * can be prefixed by the relation name; e.g., EMPLOYEE *

```
Q1C: SELECT *
FROM EMPLOYEE
```

WHERE Dno=5;

Q1D: SELECT *

FROM EMPLOYEE, DEPARTMENT

WHERE Dname='Research' AND Dno=Dnumber;

Q10A: SELECT *

FROM EMPLOYEE, DEPARTMENT;

Tables as Sets in SQL

- SQL does not automatically eliminate duplicate tuples in query results
- For aggregate operations (See sec 7.1.7) duplicates must be accounted for
- Use the keyword **DISTINCT** in the SELECT clause
 - Only distinct tuples should remain in the result

Query 11. Retrieve the salary of every employee (Q11) and all distinct salary values (Q11A).

Q11: SELECT ALL Salary

FROM EMPLOYEE;

Q11A: SELECT DISTINCT Salary

FROM EMPLOYEE;

Set operations

- UNION, EXCEPT (difference), INTERSECT
- Corresponding multiset operations: UNION ALL, EXCEPT ALL, INTERSECT ALL)
- Type compatibility is needed for these operations to be valid

Query 4. Make a list of all project numbers for projects that involve an employee whose last name is 'Smith', either as a worker or as a manager of the department that controls the project.

```
DISTINCT Pnumber
Q4A:
      SELECT
      FROM
                 PROJECT, DEPARTMENT, EMPLOYEE
      WHERE
                 Dnum=Dnumber AND Mgr_ssn=Ssn
                 AND Lname='Smith')
      UNION
      SELECT
                 DISTINCT Pnumber
      FROM
                 PROJECT, WORKS_ON, EMPLOYEE
                 Pnumber=Pno AND Essn=Ssn
      WHERE
                 AND Lname='Smith');
```

Substring Pattern Matching and Arithmetic Operators

- LIKE comparison operator
 - Used for string pattern matching
 - % replaces an arbitrary number of zero or more characters
 - underscore (_) replaces a single character
 - Examples:

```
WHERE Address LIKE '%Houston,TX%'; WHERE Ssn LIKE '__ 1__ 8901';
```

- **BETWEEN** comparison operator
 - E.g., in Q14:

WHERE (Salary **BETWEEN** 30000 **AND** 40000) **AND** Dno = 5

Arithmetic Operations

- Standard arithmetic operators:
 - Addition (+), subtraction (-), multiplication (*), and division (/) may be included as a part of **SELECT**
- Query 13. Show the resulting salaries if every employee working on the 'ProductX' project is given a 10 percent raise.

```
SELECT E.Fname, E.Lname, 1.1 * E.Salary AS Increased_sal FROM EMPLOYEE AS E, WORKS_ON AS W, PROJECT AS P WHERE E.Ssn=W.Essn AND W.Pno=P.Pnumber AND P.Pname='ProductX';
```

Ordering of Query Results

- Use ORDER BY clause
 - Keyword DESC to see result in a descending order of values
 - Keyword ASC to specify ascending order explicitly
 - Typically placed at the end of the query

ORDER BY D.Dname DESC, E.Lname ASC, E.Fname ASC

Basic SQL Retrieval Query Block

```
SELECT <attribute list>
FROM 
[ WHERE <condition> ]
[ ORDER BY <attribute list> ];
```

INSERT, DELETE, and UPDATE Statements in SQL

- Three commands used to modify the database:
 - INSERT, DELETE, and UPDATE
 - INSERT typically inserts a tuple (row) in a relation (table)
 - UPDATE may update a number of tuples (rows) in a relation (table) that satisfy the condition
 - **DELETE** may also update a number of tuples (rows) in a relation (table) that satisfy the condition

INSERT

- In its simplest form, it is used to add one or more tuples to a relation
- Attribute values should be listed in the same order as the attributes were specified in the CREATE TABLE command
- Constraints on data types are observed automatically
- Any integrity constraints as a part of the DDL specification are enforced

The INSERT Command

 Specify the relation name and a list of values for the tuple. All values including nulls are supplied.

```
U1: INSERT INTO EMPLOYEE

VALUES ('Richard', 'K', 'Marini', '653298653', '1962-12-30', '98
Oak Forest, Katy, TX', 'M', 37000, '653298653', 4 );
```

• The variation below inserts multiple tuples where a new table is loaded values from the result of a query.

U3A: CREATE TABLE WORKS_ON_INFO

(Emp_name VARCHAR(15),

Proj_name VARCHAR(15),

Hours_per_week DECIMAL(3,1);

U3B: INSERT INTO WORKS_ON_INFO (Emp_name, Proj_name,

Hours_per_week)

SELECT E.Lname, P.Pname, W.Hours

FROM PROJECT P, WORKS_ON W, EMPLOYEE E

WHERE P.Pnumber=W.Pno AND W.Essn=E.Ssn;

BULK LOADING OF TABLES

- Another variation of **INSERT** is used for bulk-loading of several tuples into tables
- A new table TNEW can be created with the same attributes as T and using LIKE and DATA in the syntax, it can be loaded with entire data.

• EXAMPLE:

```
CREATE TABLE D5EMPS LIKE EMPLOYEE
( SELECT E.*
FROM EMPLOYEE AS E
WHERE E.Dno=5 )
WITH DATA;
```

DELETE

- Removes tuples from a relation
 - Includes a WHERE-clause to select the tuples to be deleted
 - Referential integrity should be enforced
 - Tuples are deleted from only one table at a time (unless CASCADE is specified on a referential integrity constraint)
 - A missing WHERE-clause specifies that all tuples in the relation are to be deleted; the table then becomes an empty table
 - The number of tuples deleted depends on the number of tuples in the relation that satisfy the WHERE-clause

The DELETE Command

- Removes tuples from a relation
 - Includes a WHERE clause to select the tuples to be deleted. The number of tuples deleted will vary.

U4A: DELETE FROM EMPLOYEE

WHERE Lname='Brown';

U4B: DELETE FROM EMPLOYEE

WHERE Ssn='123456789';

U4C: DELETE FROM EMPLOYEE

WHERE Dno=5;

U4D: DELETE FROM EMPLOYEE;

UPDATE

- Used to modify attribute values of one or more selected tuples
- A WHERE-clause selects the tuples to be modified
- An additional SET-clause specifies the attributes to be modified and their new values
- Each command modifies tuples in the same relation
- Referential integrity specified as part of DDL specification is enforced

Example:

Change the location and controlling department number of project number 10 to 'Bellaire' and 5, respectively

U5: UPDATE PROJECT

SET PLOCATION = 'Bellaire', DNUM = 5

WHERE PNUMBER=10

• Example:

Give all employees in the 'Research' department a 10% raise in salary.

```
U6: UPDATE EMPLOYEE

SET SALARY = SALARY *1.1

WHERE DNO IN ( SELECT DNUMBER

FROM DEPARTMENT

WHERE DNAME='Research')
```

- In this request, the modified SALARY value depends on the original SALARY value in each tuple
 - The reference to the SALARY attribute on the right of = refers to the old SALARY value before modification
 - The reference to the SALARY attribute on the left of = refers to the new SALARY value after modification

Additional Features of SQL

- Techniques for specifying complex retrieval queries (see Ch.7)
- Writing programs in various programming languages that include SQL statements: Embedded and dynamic SQL, SQL/CLI (Call Level Interface) and its predecessor ODBC, SQL/PSM (Persistent Stored Module) (See Ch. 10)
- Set of commands for specifying physical database design parameters, file structures for relations, and access paths, e.g., CREATE INDEX

- Transaction control commands (Ch.20)
- Specifying the granting and revoking of privileges to users (Ch.30)
- Constructs for creating triggers (Ch.26)
- Enhanced relational systems known as object-relational define relations as classes. Abstract data types (called User Defined Types- UDTs) are supported with CREATE TYPE
- New technologies such as XML (Ch.13) and OLAP (Ch.29) are added to versions of SQL

Summary

• SQL

- A Comprehensive language for relational database management
- Data definition, queries, updates, constraint specification, and view definition

Covered:

- Data definition commands for creating tables
- Commands for constraint specification
- Simple retrieval queries
- Database update commands
